

MissKeep App

Build an app for keeping things (reference app "google keep")

Notes Variations:

Features List

- Allow creating, updating and deleting notes (CRUD)
- There are several types of notes, start with implementing:
 - `<note-txt>`
 - `<note-img>`
 - `<note-video>`
 - `<note-todos>`
- Support setting the note's background color and other styles
- Support filtering notes by search and by type
- Support pinning a note to the top of the list
- Support duplicating a note
- **Apps Integration** - Allow sending a note content straight into the compose-message page in misterEmail (use queryString Params)

More Features

- Support drag and drop of notes
- Add the following note types:
 - `<note-audio>`
 - `<note-canvas>`
 - `<note-map>`
- Special bonus: allow recording a note

Functional Design

Build the root component: `<note-app>`

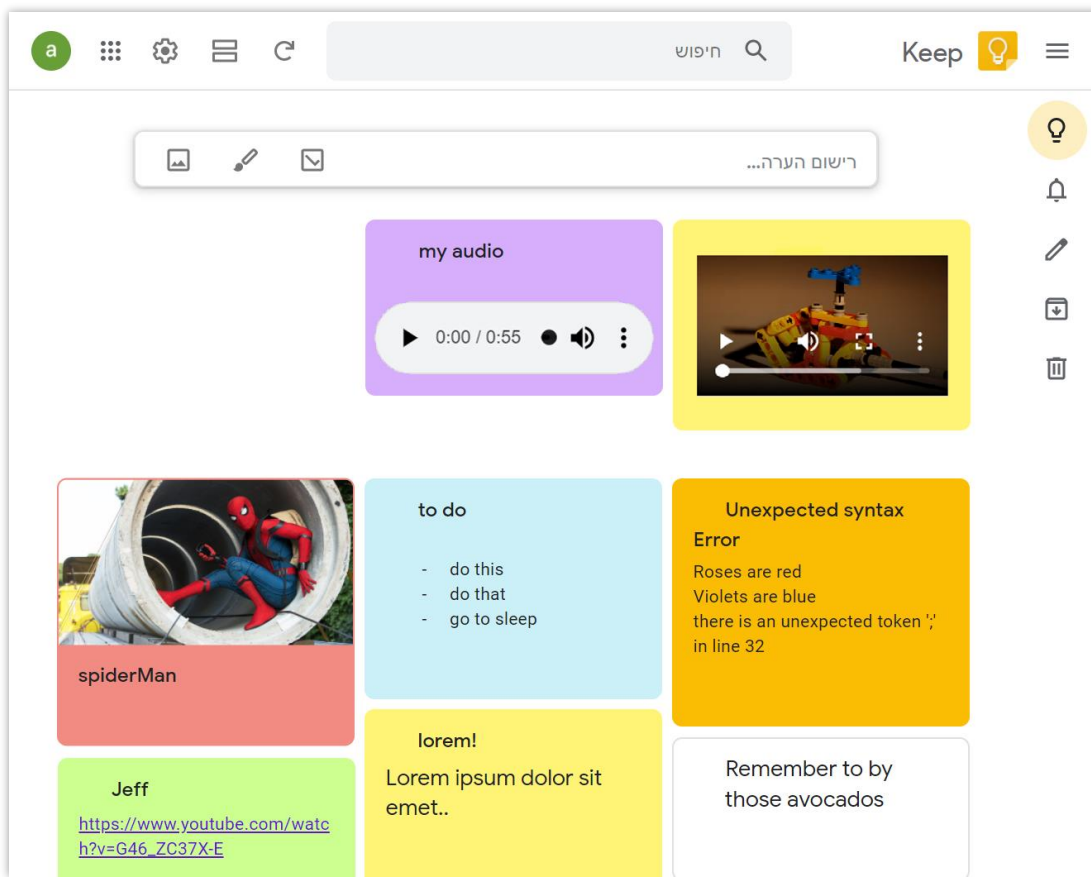

This component renders the `<note-preview>` component that allow viewing the notes preview, and also changing color, pin, etc.

The `<note-preview>` component, uses a *dynamic component* to show different types of notes

- The `noteService` manages the notes
- Here is an array of some notes:

```
const notes = [  
  {  
    id: "n101",  
    type: "note-txt",  
    isPinned: true,  
    info: {  
      txt: "Fullstack Me Baby!"  
    }  
  },  
  {  
    id: "n102",  
    type: "note-img",  
    info: {  
      url: "http://some-img/me",  
      title: "Bobi and Me"  
    },  
    style: {  
      backgroundColor: "#00d"  
    }  
  },  
  {  
    id: "n103",  
    type: "note-todos",  
    info: {  
      label: "Get my stuff together",  
      todos: [  
        { txt: "Driving liscence", doneAt: null },  
        { txt: "Coding power", doneAt: 1871111111 }  
      ]  
    }  
  }  
];
```
